

Week4 Introduction to dplyr

2024年2月3日 14:33

Main dplyr Functions

Rows

filter()

extract a subset of rows based on column values

slice()

choose rows based on location

arrange()

change the order of the rows

★ 管道符

%>%

快捷键ctrl+shift+M

输出结果传递作为输入

Columns

select()

include or exclude columns

rename()

change names of variables

mutate()

add new variables or transform existing variables

relocate()

change the order of the columns

Groups of rows

group_by()

groups by one or more variables

summarize()

collapse a group into a single row by generating summary statistics of different variables
